(54) **Syringe pumps**

(57) A syringe pump has a motor 9 rotating a lead-screw 8 to drive a plunger head actuator 10 along it. The head actuator 10 engages the plunger 35 of a syringe 3 and moves the plunger along the syringe barrel 30 to dispense medication. An optical encoder 20 mounted on the leadscrew 8 is rotated by the motor 9 to produce a pulse output. A control unit 11 times the interval be-

tween the pulses and compares these timings with a stored value representative of a predetermined multiple of the minimum time. If the head actuator 10 is obstructed, the speed of rotation of the motor 9 is slowed and the time interval between pulses rises. When this exceeds the stored value, the control unit 11 stops the drive to the head actuator 10 and generates an alarm.

**ANNEX TO THE EUROPEAN SEARCH REPORT  
ON EUROPEAN PATENT APPLICATION NO.**

EP 01 30 6561

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report.  
The members are as contained in the European Patent Office EDP file on  
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
